Ronaldo Scotti

Senior Software Engineer at Gymdesk · Exited SaaS Founder · I get AI coding agents to ship staff-level code · PHP/Laravel · TypeScript/Node · React/Vue · Postgres · Claude Code

Remote · Florianópolis, Brazil (UTC-3, overlaps US time zones) · ronaldoscottis@gmail.com · +55 48 99116-4957 (WhatsApp) · linkedin.com/in/ronaldoscottis · github.com/ronaldoscotti · ronaldoscotti.com

SUMMARY

Thirteen years as an engineer. I founded a SaaS, scaled it to 67,000 users and R$100k+ MRR, and sold it to Eduzz. Through all of it I never stopped writing code. That's the thread through everything I do: I've owned what reaches production, as the founder answering for payroll and the engineer answering for uptime.

Today I'm a Senior Software Engineer at Gymdesk, working on billing and payments for the gyms and martial arts academies that run on it. Before that I was the technical reference for a 9-person team at Eduzz. I ship with AI coding agents (Claude Code) and own the specs, gates and review loop that make that code safe to merge.

EXPERIENCE

Senior Software Engineer, Gymdesk

Oct 2026 - Present · Remote (Brazil)

Billing and payments on the Americas team of Gymdesk, the all-in-one management platform for gyms and martial arts academies.

Staff Software Engineer, Eduzz

Mar 2023 - Oct 2026 · Remote (Brazil)

The technical reference for a 9-person automation team at Eduzz, a Brazilian creator-economy platform (~R$1.2B annual GMV). I owned the automation and data-intelligence layer of the commercial operation end to end and made the technical calls.

- Architected the multi-program scoring engine that ranks the entire seller base every month, retiring **40+ hardcoded rules** for a Strategy Pattern core new programs plug into. A Bayesian confidence layer keeps a seller with a handful of sales off the same scale as one with thousands.
- Owned the automation and observability layer for chargebacks and disputes across four payment providers (Stripe, Pagar.me, Mercado Pago, Iugu). PSP webhooks duplicate and arrive out of order, so I keyed idempotency on the provider event id and **killed a production bug where one chargeback fired six times and was acted on six times**.
- Shipped daily with AI coding agents (Claude Code), owning the prompts, evals, guardrails and review loop that keep agent-authored code production-safe. **Features that used to cost a senior engineer a week now take a day or two.**
- Built the product-pipeline API the commercial team runs on: parallel fan-out across four databases (SQL Server, MySQL, MongoDB, Postgres) with graceful degradation and a cache that **trades freshness for ~50-70% lower latency and ~90% less database load**.
- Shipped a config-driven qualification engine that has processed **2M+ user qualifications**, publishing completion events to RabbitMQ through an idempotent event-log outbox, plus the observability behind it (fail-open logging to Elasticsearch, correlation-id tracing, Kibana).
- Designed the living documentation platform for the company's automations: 800+ HubSpot workflows, 50+ pipelines and 300+ custom properties. A deterministic pipeline decides what changed and an AI layer writes only inside a fenced region of each doc, regenerated daily.

Stack: TypeScript · Node.js · Next.js · SQL Server · PostgreSQL · MySQL · MongoDB · Redis · RabbitMQ · Elasticsearch · Databricks · Claude Code / LLM agents · HubSpot · Botpress

Founder & CEO (exit), Orbit (acquired by Eduzz)

Sep 2019 - Mar 2023

Founded Orbit Pages, a landing-page SaaS for digital creators, and ran it to the acquisition.

- Built the product solo (8 months to first sale) and grew it to 67,000 free users, 1,500 paying customers and R$100k+ MRR, serving millions of page visits monthly.
- Drove MRR from R$30k to R$100k in about six months and reached profitability after a planned VC round fell through post-pandemic, on freemium upgrade prompts and A/B-tested pricing.
- Moved annual-plan revenue **from 20% to 80%** of the mix by redesigning the upgrade page defaults, zero new features. It paid off in LTV and cashflow more than in MRR.

- Stayed lead architect throughout, re-platforming the V1 onto S3 + Vercel with critical integrations on Kubernetes while running business, investors and support. The V1 still runs today, years after the exit.
- Scaled the team from 2 to 18 and back to the lean 7 that ran it to the acquisition.

Stack: Laravel (PHP) · Node.js · AWS (S3) · Vercel · Kubernetes

Full-Stack Engineer, Orbit Web

Sep 2015 - Sep 2019

An independent full-stack practice across hundreds of projects, where I went from delivery work to designing the payment and commerce systems clients trusted with real money. PHP, JavaScript, WordPress, React, Vue, Node.

- **Custom payment checkout (Doutor Nature):** designed and built a multi-gateway checkout over 5 months to replace a full-suite provider so the client could keep the installment interest: gateways behind one shared interface, idempotency keyed on cart + product, reconciliation against processor APIs, splits, installments, CRM and shipping. Processed **~R$3M in its first full production month** (+13-15% gains).
- **Bitcoin-transacting e-commerce, from scratch:** built a full crypto-payment store in raw PHP (MVC) to a client's spec.
- **Selected clients:** Bruno Souza (Java Champion), who trusted me with his businesses and referred his own mentees and network; ACE Startups, engineering on venture-builder and digital-transformation work for Natura, Banco BMG and Algar Telecom; and The Developer's Conference, Brazil's largest developer conference.

Stack: PHP · JavaScript · WordPress · React · Vue · Node.js

LANGUAGES & SKILLS

Languages: Portuguese (native) · English (full professional)

Languages & Frameworks: TypeScript · Node.js · React · Vue · PHP/Laravel · Capacitor (native iOS/Android) · SQL

Data & Infrastructure: PostgreSQL · SQL Server · MySQL · MongoDB · Redis · AWS · Docker · Kubernetes · Databricks · DevOps & CI/CD (Jenkins) · Git

AI & LLM: LLM Applications · AI Agents & MCP · Prompt Engineering · AI-assisted development (Claude Code)

Architecture & Practice: System Design · Software Architecture · Data Pipelines · Systems Integration · Performance Optimization · Security Best Practices · Code Review · Automated Testing · Technical Leadership · Technical Documentation · Technical Writing

SIDE PROJECTS

Meu Feed Católico. A Catholic devotional platform I build and run solo (Laravel API + Vue 3, shipping to web, PWA and native iOS/Android from one codebase via Capacitor). Standout engineering: multi-canon Bible modeling with versification mapping, idempotent corpus-ingestion pipelines, and SPA crawler-prerendering. The Laravel API carries a 770-test suite.

Temperamentos Online (temperamentos.online). A Catholic temperament assessment with a versioned, fully deterministic scoring engine isolated from the framework (its own 35-test suite), so results stay reproducible as the method evolves. Laravel, Inertia, React 19, TypeScript.

Nova Aba Católica (Chrome Web Store). Chrome extension (Manifest V3) that turns every new tab into a moment of prayer: daily liturgy, saint of the day, meditation. Vercel serverless backend, PT/EN.

EDUCATION

- **MBA, Technology for Business: AI, Data Science and Big Data**, PUCRS (2019-2020)
- **B.Sc., Computer Science**, Centro Universitário Unifacvest (2012-2015)
